

Über den Job

Love what you do – we make employment happen!

Turn data into impact!

JobCloud connects hundreds of thousands of job seekers with employers every day and behind every product decision is data. As our next Senior Data Engineer, you'll own the warehouse stack that makes that possible: well-designed data models, performant SQL, and a single source of truth that teams across the company actually rely on.

What sets you apart is that you're equally at home in a technical deep-dive and a business requirements discussion - you don't just model what you're told, you understand why it matters and aren't afraid to challenge assumptions when something doesn't add up. If you want real ownership, an established stack to evolve, and colleagues who'll push you to do your best work, this is the role.

We are looking for someone based in or willing to work from our offices in Zurich or Geneva.

Learn more about our [unique culture](#) and [why you should work at JobCloud](#).

This is us: You've surely heard of jobs.ch. This is just one of the many brands owned by JobCloud. We are the leading player in Switzerland's online job market and want to make job search and recruitment as easy as possible. Love what you do – we make employment happen!

By the way: We don't care about your skin colour, your gender identity or your beliefs... Come as you are, you are just good.

YOUR TASKS

- Own and evolve our data warehouse stack (Matillion, Redshift, Tableau), ensuring reliability, performance, and long-term scalability
- Design and maintain sustainable business data models that serve as the single source of truth for reporting and analytics

- Develop and optimize complex SQL transformations and ETL pipelines using Matillion to support business-critical use cases
- Manage master data processes to ensure accurate consolidation and consistency across all connected systems
- Translate business requirements into well-structured, documented data models – challenging assumptions where needed
- Collaborate closely with BI and analytics consumers to ensure data is accessible, understandable, and fit for purpose
- Share knowledge through documentation, internal presentations, and active cross-functional collaboration

YOUR SKILLS

- 3+ years of experience in data warehouse development and data modeling, ideally with Redshift and Matillion
- Advanced SQL skills with a strong focus on query performance, scalability, and maintainable transformation logic
- Solid experience designing dimensional or relational business data models for analytical use cases
- Working knowledge of AWS services relevant to the warehouse layer, particularly S3, Redshift, and Lambda
- Familiarity with BI tools – preferably Tableau – with a good eye for how model design impacts end-user experience
- Experience with master data management and cross-system data consolidation
- Strong business acumen combined with structured analytical thinking – you ask the right questions and bridge the gap between stakeholders and data
- Python skills and experience with Infrastructure as Code and Ansible are a plus
- Fluent in English, German is a plus
